

E.cuniculi is a microscopic parasite that is widespread across the UK.

Over 50% of apparently healthy pet rabbits have been exposed to it and if left untreated may have very nasty consequences:

- Head tilt
- Blindness
- Hind limb weakness
- Kidney disease
- Seizure
- ...and even death

It is spread by infected urine, or between mothers and babies and can live in infected areas for weeks.

Sadly, treatment is not always successful and prevention has not been available.

But luckily for rabbits, things have now changed!

**Panacur[®]
Rabbit**

is now available to help prevent *E.cuniculi*.

Since prevention is better than cure ask your vet for

**Panacur[®]
Rabbit
TODAY!**

Panacur Rabbit contains 5g of an 18.75% oral paste formulation. Uses: A broad spectrum anthelmintic as an aid in the control of *Encephalitozoon cuniculi* and intestinal worms in domestic rabbits. This veterinary medicine is marketed under the Small Animal Exemption Scheme.

We are all used to worming our cats and dogs, but did you know it's important to worm your rabbit too?

Rabbits are now the third most popular pet in the UK, after cats and dogs.

They are great companions and make wonderful pets, but rabbits can also suffer from worms and parasites such as *E.cuniculi*.

About Panacur[®] Rabbit

Panacur Rabbit has been developed to provide a single answer to the problem of worms and parasites such as *E.cuniculi*.

By using Panacur Rabbit regularly you can have peace of mind that you are giving your rabbit the best possible protection available.

Giving Panacur Rabbit is easy!

The pleasant tasting paste is administered via a plastic syringe dispenser - 1 syringe graduation should be given per 2.5kg bodyweight daily for 9 days.

For accurate dosing, it's important to weigh your rabbit. So while you are seeing the vet today why not have your rabbit weighed?

Panacur Rabbit should be given 2-4 times a year and at high risk periods such as when you first acquire your rabbit, prior to mating and when mixing with other rabbits.

Tips for easy administration:

- Calculate the dose required and move the locking ring so that it lines up with the required graduation
- Ensure your rabbit is safely restrained; it may be useful to wrap him/her in a towel if nervous when handled
- Insert the tip of the syringe gently into the side of the rabbit's mouth behind the front teeth and slowly depress the plunger

Other preventative measures

In addition to using Panacur Rabbit, you should also observe some simple hygiene rules to help keep *E.cuniculi* away:

- Avoid collecting fresh greens from areas where there are wild rabbits or rodents
- Regularly disinfect food bowls and water dispensers (feed racks are useful as they prevent soiling with faecal matter or urine)
- Use separate rather than tiered housing to help prevent urine splash
- Place hutches where exposure to wild rabbits and rodents is minimised.
